

Week 5 & 6: Player Movement & Zombie System Development

Activities Performed:

- Implemented keyboard controls for the player character.
- Added player movement using the W, A, S, and D keys.
- Implemented movement in four directions: up, down, left, and right.
- Added boundary checking to prevent the player from moving outside the game window.
- Created the zombie system for the game.
- Added multiple zombies to the game screen.
- Implemented random positions for spawning zombies.
- Implemented zombie movement toward the player.
- Tested the player movement and zombie movement systems.

Implementation Details:

During this phase, the player movement system was connected to the game loop. The player can move around the game screen using the keyboard. Boundary checking was also implemented so that the player cannot move outside the game window.

The zombie system was then added to the game. Multiple zombies are created at random positions on the screen. Each zombie continuously moves toward the player's current position, creating the basic survival gameplay.

Controls:

Key	Function
W	Move Up
S	Move Down
A	Move Left
D	Move Right

Outcome:

The player movement and zombie systems were successfully implemented. The player can move freely within the game boundaries using the keyboard, while multiple zombies spawn on the game screen and move toward the player.

The basic gameplay interaction between the player and zombies is now functional. The project is ready for implementing the shooting and collision detection system in the next phase.
